TASKMATE – TESTING AND TEST RESULTS

1. INTRODUCTION

Testing is an important part of software development. It helps check whether the TaskMate application works as expected and identify errors.

2. OBJECTIVES OF TESTING

- Check the application features.
- Identify errors and bugs.
- Verify that user actions work correctly.
- Ensure the application is easy to use.
- Improve the reliability of the application.
-

3. TYPES OF TESTING

- Functional Testing: Checks whether each feature works correctly.
- Usability Testing: Checks whether the application is easy to use.
- Interface Testing: Checks the layout and interaction of screens.
- Validation Testing: Checks whether the application accepts appropriate inputs.

4. TEST CASES

Test Case	Expected Result
Open the application	Home screen should appear
Add a task	Task should be added, if supported
View task list	Available tasks should be displayed
Update task status	Status should update, if supported
Enter empty task details	Appropriate validation should occur, if implemented

5. TEST RESULTS

Run each test case on the actual application and record the result as Pass or Fail. Do not mark a test as passed until it has been tested.

6. BUG REPORTING

If a feature does not work as expected, record the issue, steps to reproduce it, expected result, and actual result.

7. CONCLUSION

Testing helps identify problems and verify the implemented features of TaskMate. It supports improving the application's quality and reliability.
